Experiences:

Evan: I worked alongside my teammate Jose to focus on designing a front-end user face for the project. I learned a lot about HTML and CSS as well as other concepts such as angular routing and components in order to help create a good flowing website.

Jose: Worked with Evan Smith, utilized GitHub for efficient group work and developed front end together. The major thing I learned was web development. Prior to this project, I had zero experience with web development and I learned a lot about html, routing, and typescript via the angular framework. I also learned how to effectively coordinate with Evan via github. We were able to share code effectively in order to create the front-end UI as well as learning how to implement backend and frontend communication via an api that Josh and Paul worked to create. I learned the foundations of web development.

Josh: Set up database and created data tables to store all the website's data. Learned a lot about developing good databases in a real-world scenario.

Mitchell: Learned how the front end and back end connect through the different frameworks that are available. Helped early on with the front end then mostly with GIT later on through the project.

Nick: I learned how to apply UML Diagrams in a real-world scenario when I set up the angular components. Also, I learned how to use Git to collaborate with others for a project. Finally, I learned about web development when I tried to set up the connection between Angular and Node.js.

Paul: Learned about frameworks. I Learned what Node what a framework was and we made a Node Server also learned HTTP protocols and how to send information over HTTP. I helped set up the Node Server, worked with sending data through HTTP between servers and put together the framework. I also used a lot of google.
